## FILTER SELECTION GUIDE

### Protection Factors for Respiratory Protective Equipment

	Classification	NPF*	APF**
<b>DISPOSABLE DUST MASKS (EN 149)</b>			
(Moulded, Fold Flat & Deluxe Fold Flat)	FFP1	4.5	4
	FFP2	12.5	10
	FFP3	50	20
<b>REUSABLE DUST MASKS (EN 1827)</b>			
Tradesman1	FMP1	4.5	4
	FMP2	12.5	10
<b>28 DAY MASKS (EN 405)</b>			
(FilterJet, MaxiJet & Tradesman2)	FF Gas +P1	4.5	4
	FF Gas +P2	12.5	10
	FF Gas +P3	50	10
<b>HALF MASKS (EN 140)</b>			
(Midimask, Maximask, Maximask 2000 & Tradesman3)	P1	4.5	4
	P2	12.5	10
	P3	50	20
	Gas	50	10
	Gas + P3	-	10
<b>FULL FACE MASKS (EN 136)</b>			
(Olympus Full Face Mask)	P2	17	10
	P3	1000	40
	Gas	2000	20
	Gas + P3	-	20
<b>POWERED RESPIRATORS (EN 12941)</b>			
(Powercap)	TH1P	-	10
(Jetstream)	TH2PSL	-	20
(Jetstream)	TH2A2	-	20
(Jetstream)	TH2A2PSL	-	20
<b>COMPRESSED AIRLINE HALF MASK (EN 139)</b>			
(Air Fed Half Mask)	-	50	20
<b>COMPRESSED AIRLINE BREATHING APPARATUS (EN 270)</b>			
(Air Fed Faceshield)	-	200	40

# FILTER SELECTION GUIDE

### NPF, Nominal Protection Factor

Offer a guide to the potential performance of a respirator. They are calculated by dividing 100 by the maximum allowed total inward leakage value as specified by the relevant standard.

For example:

FFP3 disposable dust mask to EN 149, maximum allowed inward leakage is 2%,  $100 \div 2 = 50$ . Therefore the minimum Nominal Protection Factor of an FFP3 device to meet the requirements of EN 149, is 50.

### APF, Assigned Protection Factor

Are designed to indicate a respirator's realistic level of performance in the workplace. They assume that the equipment is correctly selected, fitted and maintained, and that the protection levels will be achieved by 95% of the work force. The figures for APF's are much lower than the NPF's. A consequence of this is that in areas where respirators and breathing apparatus have been working close to the NPF levels, these procedures will have to be reviewed. Readers are reminded that under Regulation 6 of COSHH (Control of Substances Hazardous to Health) that a full and comprehensive assessment should be carried out prior to work commencing.

NOTE the WEL figures in this document are long term exposure limits (8 hour reference period) and where available the short-term exposure limit (15 minute reference period) has also been included. WEL's are listed in ppm – parts per million or mg/m<sup>3</sup> - milligrams per metre cubed.

1ppm = 2.58mg/m<sup>3</sup> @ 25 C and 1 ATM.

WEL is a UK unique technical term, the data in these columns is set by the UK HSE and do not apply outside the UK. For other countries the country's national safety executive should be consulted on exposure levels for hazardous substances.

Selecting the correct respiratory device, whether disposable mask or cartridge respirator, requires an understanding of the hazard that is going to be encountered. The following information needs to be considered and can be found through reference to various documents, including the hazard's Material Safety Data sheet, relevant Health & Safety Executive Publications, this document and the risk assessment report.

1. What is the name of the hazard?
2. In what form is the hazard encountered?
3. What other applicable regulations may affect selection?
4. What is the Workplace Exposure Limit for the hazard?
5. What is the airborne concentration of the hazard?
6. How long will the workers be exposed to the hazard within any given 24 hour period ?

# FILTER SELECTION GUIDE

With this information it is possible to determine the Time Weighted Average concentration (TWA), by using the relevant equation.

**Long Term Exposure:** (Concentration x Time of exposure)/8

**Short Term Exposure:** (Concentration x Time of exposure)/0.25

By ascertaining the result of TWA divided by WEL it is possible to determine the minimum required efficiency of the appropriate filter.

The five forms of hazard that are commonly encountered in the work place are:

Dust	Formed by the breaking down of solid materials. In general the smaller the dust particle the greater the hazard. Fibres of material should be treated as dusts.
Mist	Formed by processes that involve atomisation (such as spraying) and consist of tiny liquid droplets.
Fume	Formed by the vaporisation of a solid material by the application of intense heat. Extremely fine solid particles are formed as the vapour cools and condenses.
Vapour	A gaseous state formed by evaporation from substances that are normally either solid or liquid at room temperature. A fume may form as the vapour cools.
Gas	An air-like substance at room temperature. Gases can travel very far, very quickly.

An example using Assigned Protection Factors to calculate the actual protection required:

**Concentration of contaminant (ppm) / WEL (ppm) = Minimum required protection factor**

**E.g. Xylene is present at a concentration of 800ppm. The WEL is 100 ppm:  $800 \div 100 = 8$**

Therefore a half mask with an A1 gas filter, which has an APF of 10 is appropriate.

### Carcinogens, mutagens and substances toxic for reproduction

Substances in these categories are shown as follows

1. carcinogenic of category 1 or 2 (shown as category C1 or C2),
2. mutagenic of category 1 or 2 (shown as category M1 or M2)
3. toxic for reproduction of category 1 or 2 (shown as category R1 or R2)
